Vertical Integration in NAP
Processes

What is vertical integration?

In the context of the NAP process, vertical integration is:

The process of creating intentional and strategic linkages between national and sub-national adaptation planning, implementation and monitoring & evaluation (M&E)

Vertical integration outcomes

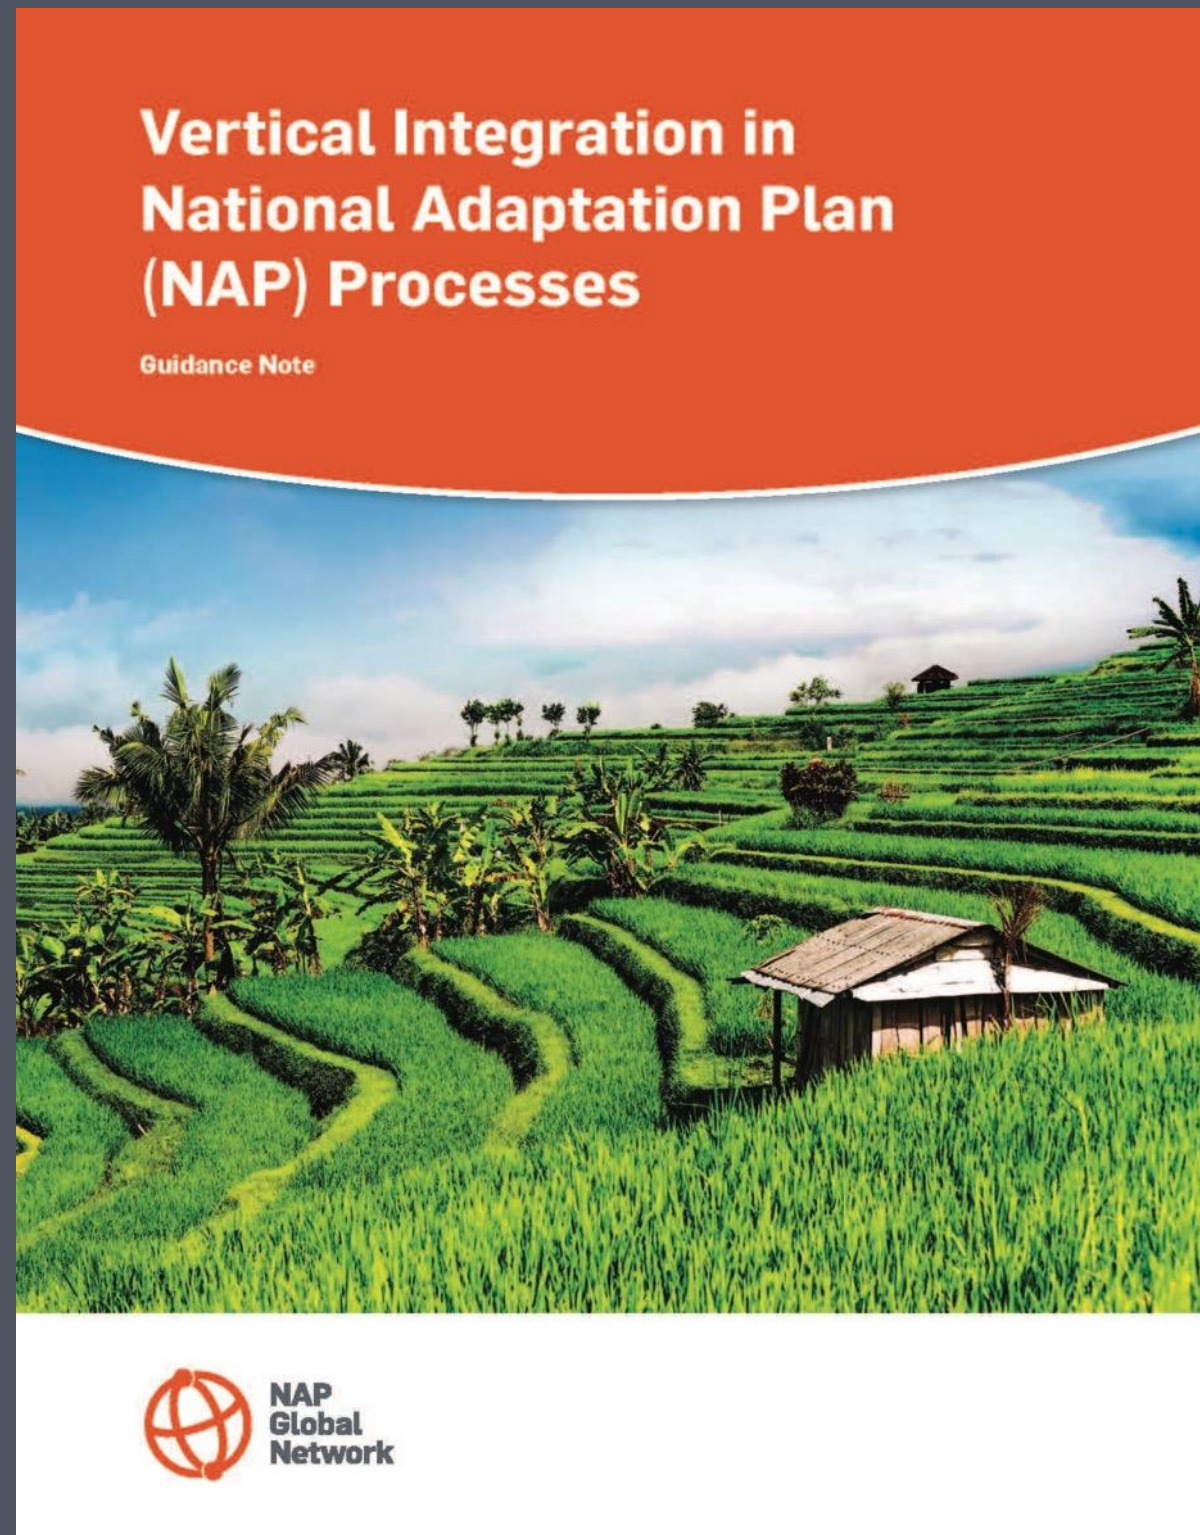

Enabling factors for vertical integration

	Planning	Implementation	Monitoring & Evaluation
Institutional Arrangements	Mechanisms exist to link national and sub-national adaptation planning processes	Mechanisms exist and resources have been allocated for ongoing coordination between national and sub-national actors	Mechanisms exist for linking national and sub-national M&E systems
Information Sharing	Relevant information is shared between national and sub-national levels to facilitate adaptation planning	Actors at all levels have the information they need for efficient and effective implementation of adaptation	Information is generated and exchanged between national and sub-national levels on an ongoing basis
Capacity Development	Actors at national and sub-national levels have capacity to engage in coordinated and mutually supportive adaptation planning processes	Sub-national actors have capacity for long-term planning and implementation of adaptation	Sub-national actors have capacity to monitor and evaluate adaptation

The Guidance Note

- Flexible, targeted guidance for strengthening vertical integration in NAP processes
- Complementary to other guidance
- Structured around key issues and enabling factors for planning, implementation and M&E
